

KVOTE 2009

case study

Software for automatic evaluation of the results from the election process in Republic of Kosovo

Client: Central Election Commission of Kosovo

Industry: Public Sector

Description:

The team of iVote Technologies together with the local partner Ilir Kosova, was selected by the Central Election Commission of Kosovo to implement the IT system for the Count and Results Centre.

Challenge:

When designing the software we were guided by the objective of the Kosovo Elections - to allow **transparent, secure and correct results for the local elections**. The CEC of Kosovo wanted to collect all the materials and items from all over Kosovo, from all Municipalities and Polling Stations and insert all Results forms and all items into the system, and to have better image about the process of collecting and insertion of the items and the final results.

Solution:

The K-Vote System (Kosovo Election System) is a system that is designed and developed for Automatic evaluation of the results from the election process for the national elections in Kosovo. It is designed to collect all the required data for validation and verification of the Results (Final Voters Lists, Conditional Ballot Envelopes, Regular Result Forms, Batch Result Forms etc.) with tracking for all the documents that are received into the Counting and Results Center. The system is multi-User with several Different User Types and allows: **Intake for each different document and Item, Tracking of the documents and Items, Data Entry for the Results Forms, Voters from Regular Voter Lists and Conditional Ballots Envelopes, Archiving the results, keeping History for each entry and user behavior and Generating the Results.**

Success:

The time needed to process and publish the results has greatly reduced compared to the previous elections, giving the CEC a clear picture of the state during the whole election process
